Doctor Referral Network

By Nolan and Jay

01

The Problem

System Friction is Breaking Care

- Patients often go to the ER unnecessarily
- Referral Processes are not fast or seamless, leaving patients with the ER as the only option

Why Now?

Healthcare is Actively Shifting

The system was never an issue of volume but an issue of the structure.

Doctors and specialists weren’t being utilized properly and we are here to change that.

1 in 5 visits in ER are unnecessary

– Canadian Institute for Health Information

The Solution

MedRelay

Impact Potential

We tackle key pain points in the healthcare industry, fitting into the 4 categories and taking a novel approach to a fundamentally communication based problem.

Decentralization from the ER

Decentralization from the ER Room, focusing on connection to allow specialized care for those without family doctor or those in need of immediate medical attention.

Efficient Patient Routing

Enables patients with the right level of care at all times, whilst reducing the backlog of patients in the ER and reducing wait-times for the patient in need.

Enabling Remote Care

Referrals can be done remotely and referral appointments can be done remotely, removing the patients' need of travelling, and lowering the number of patients waiting for care in the ER

Future Outlook

Following the industry practices of being a HIPAA compliant software and creating automated referral processes.

Thanks!
